Lab-View Network Device MAC Addresses

Part1

Step 1

Step 2:

Interface: FastEthernet0

IP Configuration

☐ DHCP ☒ Static

IPv4 Address: 192.168.1.3

Subnet Mask: 255.255.255.0

Default Gateway: 192.168.1.1

DNS Server: 0.0.0.0

IPv6 Configuration

☐ Automatic ☒ Static

IPv6 Address: /

Link Local Address: FE80::202:4AFF:FE58:8080

Default Gateway:

DNS Server:

```
C:\>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\>
```

The pings were not successful yet, because the switch has not been configured.

Step 3:

a.&b.&c.&d.

```
Switch>enable
Switch#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#hostname S1
S1(config)#no ip domain-lookup
S1(config)#interface vlan 1
S1(config-if)#ip address 192.168.1.2 255.255.255.0
S1(config-if)#no shutdown

S1(config-if)#
%LINK-5-CHANGED: Interface Vlan1, changed state to up

%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to up

S1(config-if)#end
S1#
%SYS-5-CONFIG_I: Configured from console by console
```

Step 4:

```
C:\>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Request timed out.
Reply from 192.168.1.2: bytes=32 time<1ms TTL=255
Reply from 192.168.1.2: bytes=32 time<1ms TTL=255
Reply from 192.168.1.2: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

The pings were successful.

Part 2

Step 1:

(a)

- What is the OUI portion of the MAC address for this device?

5C-26-0A *Type your answers here.*

- What is the serial number portion of the MAC address for this device?

24-2A-60 *type your answers here.*

- Using the example above, find the name of the vendor that manufactured this NIC.

Dell Inc.

(b)

From the command prompt on PC-A, issue the `ipconfig /all` command and identify the OUI portion of the MAC address for the NIC of PC-A.

```
C:\>ipconfig /all

FastEthernet0 Connection: (default port)

    Connection-specific DNS Suffix...:
    Physical Address.....: 0002.4A58.8080
    Link-local IPv6 Address.....: FE80::202:4AFF:FE58:8080
    IPv6 Address.....: ::
    IPv4 Address.....: 192.168.1.3
    Subnet Mask.....: 255.255.255.0
    Default Gateway.....: ::
                                192.168.1.1
    DHCP Servers.....: 0.0.0.0
    DHCPv6 IAID.....:
    DHCPv6 Client DUID.....: 00-01-00-01-76-DB-95-7B-00-02-4A-58-80-80
    DNS Servers.....: ::
                                0.0.0.0
```

- identify the OUI portion of the MAC address for the NIC of PC-A.

00-02-4A

- Identify the serial number portion of the MAC address for the NIC of PC-A.

58-80-80

- Identify the name of the vendor that manufactured the NIC of PC-A.

00-02-4A	(hex)	Cisco Systems, Inc
00024A	(base 16)	Cisco Systems, Inc
		80 West Tasman Drive
		San Jose CA 94568
		US

Cisco Systems, Inc

Step 2:

Console into S1 and use the show interfaces vlan 1 command to find the MAC address information.

```
S1>enable
S1#show interface vlan 1
Vlan1 is up, line protocol is up
  Hardware is CPU Interface, address is 0000.0c02.ee6d (bia 0000.0c02.ee6d)
  Internet address is 192.168.1.2/24
  MTU 1500 bytes, BW 100000 Kbit, DLY 1000000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input 21:40:21, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
    1682 packets input, 530955 bytes, 0 no buffer
    Received 0 broadcasts (0 IP multicast)
    0 runs, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    563859 packets output, 0 bytes, 0 underruns
    0 output errors, 23 interface resets
    0 output buffer failures, 0 output buffers swapped out
S1#
```

- What is the MAC address for VLAN 1 on S1?

0000.0c02.ee6d

- What is the MAC serial number for VLAN 1?

02-ee-6ds *here*.

- What is the OUI for VLAN 1?

00-00-0C *Type your answers here*.

- Based on this OUI, what is the name of the vendor?

		UU
00-00-0C	(hex)	Cisco Systems, Inc
00000C	(base 16)	Cisco Systems, Inc
		170 WEST TASMAN DRIVE
		SAN JOSE CA 95134-1706
		US

Cisco Systems.

- What does bia stand for?

Burned in address.

- Why does the output show the same MAC address twice?

The MAC address can be changed via a software command and the actual address will still be there.

(b)

```
S1>enable
S1#show arp
Protocol Address      Age (min)  Hardware Addr  Type   Interface
Internet 192.168.1.2      -         0000.0C02.EE6D  ARPA   Vlan1
Internet 192.168.1.3      59        0002.4A58.8080  ARPA   Vlan1
S1#show mac address-table
          Mac Address Table
-----
Vlan    Mac Address      Type        Ports
----    -
1       0002.4a58.8080   DYNAMIC     Fa0/6
```

- What Layer 2 addresses are displayed on S1?

0000.0C02.EE6D

0002.4A58.8080.

- What Layer 3 addresses are displayed on S1?

192.168.1.2

192.168.1.3

Step 3:

- Did the switch display the MAC address of PC-A? If you answered yes, what port was it on?

```
S1>enable
S1#show arp
Protocol Address      Age (min)  Hardware Addr  Type   Interface
Internet 192.168.1.2      -         0000.0C02.EE6D  ARPA   Vlan1
Internet 192.168.1.3      59        0002.4A58.8080  ARPA   Vlan1
S1#show mac address-table
          Mac Address Table
-----
Vlan    Mac Address      Type        Ports
----    -
1       0002.4a58.8080   DYNAMIC     Fa0/6
```

Yes. Port should be F0/6, the MAC address would be 0002.4a58.8080.

Reflection Questions

1. Can you have broadcasts at the Layer 2 level? If so, what would the MAC address be?

I can have broadcasts at Layer 2.

ARP will use broadcasts to find MAC address information.

The broadcast address is FF.FF.FF.FF.FF.FF.

2. Why would you need to know the MAC address of a device?

In a large network, it may be easier to pinpoint location and identity of a device by its MAC address instead of its IP address. The MAC OUI will list the manufacturer, which may help narrow down the search. Security measures can be applied at Layer 2, so knowledge of allowable MAC addresses is needed.

    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 watchdog, 0 multicast, 0 pause input
    0 input packets with dribble condition detected
    2357 packets output, 263570 bytes, 0 underruns
    0 output errors, 0 collisions, 10 interface resets
    0 babbles, 0 late collision, 0 deferred
    0 lost carrier, 0 no carrier
    0 output buffer failures, 0 output buffers swapped out

S2#show mac address-table
    Mac Address Table
-----
Vlan    Mac Address      Type      Ports
----
1       0002.1732.3301   DYNAMIC   Fa0/1
S2#
```

☐ Top

- Are there any MAC addresses recorded in the MAC address table?

Yes.

- What MAC addresses are recorded in the table? To which switch ports are they mapped and to which devices do they belong? Ignore MAC addresses that are mapped to the CPU.

The S1's MAC address recorded in via Fa0/1 switch port.

- If you had not previously recorded MAC addresses of network devices in Step 1, how could you tell which devices the MAC addresses belong to, using only the output from the show mac address-table command? Does it work in all scenarios?

"show mac address-table command" shows the port that the MAC addresses were learned on and it would identify the MAC address belongs to which network device in the simple network system.

But when multiple MAC addresses associated to the same port or the device uses a dynamic address, MAC addresses might not be directly correlated with specific devices.

Step 3:

a.

```
S2#clear mac address-table dynamic
S2#
```

b.

```
S2#show mac address-table
Mac Address Table
-----
Vlan    Mac Address      Type    Ports
----    -
1       0002.1732.3301   DYNAMIC Fa0/1
S2#show mac address-table
Mac Address Table
-----
Vlan    Mac Address      Type    Ports
----    -
1       0002.1732.3301   DYNAMIC Fa0/1
S2#
```

- Does the MAC address table have any addresses in it for VLAN 1? Are there other MAC addresses listed?

No. Just S1's MAC address re-recorded in via Fa0/1 switch port.

- Wait 10 seconds, type the show mac address-table command, and press Enter. Are there new addresses in the MAC address table?

No, the same line showed.

Step 4:

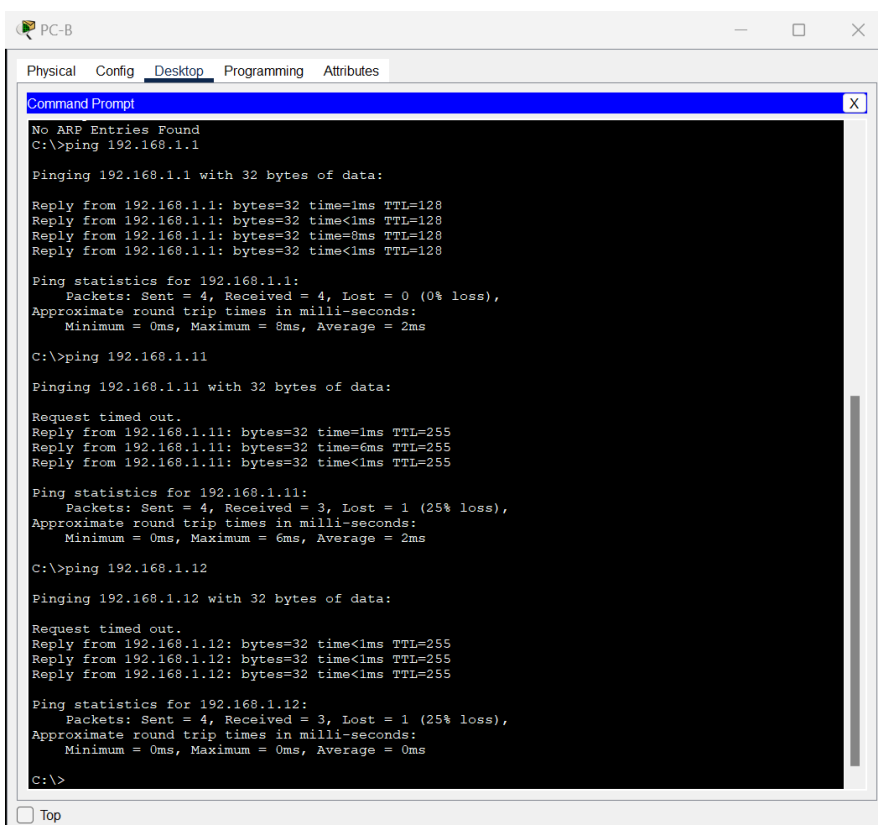

a.

```
C:\>arp -a
No ARP Entries Found
C:\>|
```

- Not including multicast or broadcast addresses, how many devices IP-to-MAC address pairs have been learned by ARP?

ARP cache have no entries in it.

b.

The screenshot shows a Windows Command Prompt window titled "PC-B" with tabs for Physical, Config, Desktop, Programming, and Attributes. The Command Prompt window is active and displays the following text:

```
Command Prompt
No ARP Entries Found
C:\>ping 192.168.1.1

Pinging 192.168.1.1 with 32 bytes of data:

Reply from 192.168.1.1: bytes=32 time<1ms TTL=128
Reply from 192.168.1.1: bytes=32 time=6ms TTL=128
Reply from 192.168.1.1: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 6ms, Average = 2ms

C:\>ping 192.168.1.11

Pinging 192.168.1.11 with 32 bytes of data:

Request timed out.
Reply from 192.168.1.11: bytes=32 time=1ms TTL=255
Reply from 192.168.1.11: bytes=32 time=6ms TTL=255
Reply from 192.168.1.11: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.1.11:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 6ms, Average = 2ms

C:\>ping 192.168.1.12

Pinging 192.168.1.12 with 32 bytes of data:

Request timed out.
Reply from 192.168.1.12: bytes=32 time<1ms TTL=255
Reply from 192.168.1.12: bytes=32 time<1ms TTL=255
Reply from 192.168.1.12: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.1.12:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>
```

- Did all devices have successful replies? If not, check your cabling and IP configurations.

Yes, all devices have successful replies.

c.

- Has the switch added additional MAC addresses to the MAC address table? If so, which addresses and devices?

Yes, including S1(1st line), PC-A(4th line) , PC-B(2nd line),

```
S2#show mac address-table
Mac Address Table
-----
```

Vlan	Mac Address	Type	Ports
1	0002.1732.3301	DYNAMIC	Fa0/1
1	00d0.ff9d.444d	DYNAMIC	Fa0/18
1	00e0.f979.52e1	DYNAMIC	Fa0/1
1	00e0.f9d2.1845	DYNAMIC	Fa0/1

```
S2#
```

- Does the PC-B ARP cache have additional entries for all network devices that were sent pings?

Yes, PC-A(1st line), S1(2nd line), S2(3rd line).

```
C:\>arp -a
```

Internet Address	Physical Address	Type
192.168.1.1	00e0.f9d2.1845	dynamic
192.168.1.11	00e0.f979.52e1	dynamic
192.168.1.12	0005.5eb3.6114	dynamic

```
C:\>|
```

Reflection Question: what might be some of the challenges on larger networks?

1. **ARP Cache Size Limitations:** on the large network system, the number of entries may surpass the capacity of the caches.
2. **MAC Address Table Scalability:** the number of MAC addresses can handle may limited.
3. **Dynamic Nature of Devices:** Devices on the large network are often dynamic, the displayed data deviates from the real situation.

Packet Tracer-

Build a Switch and Router Network - Physical Mode

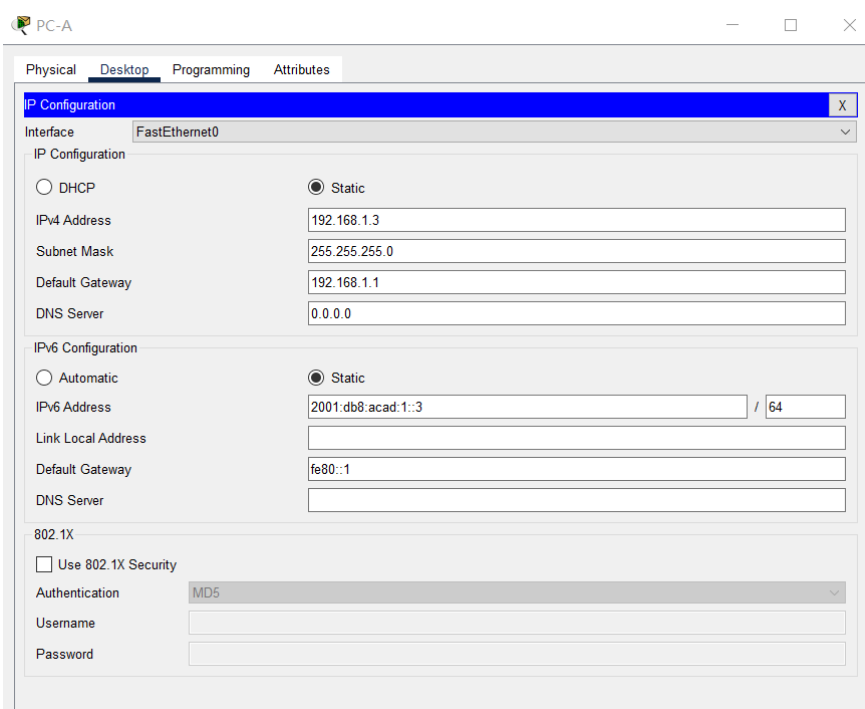

Part1

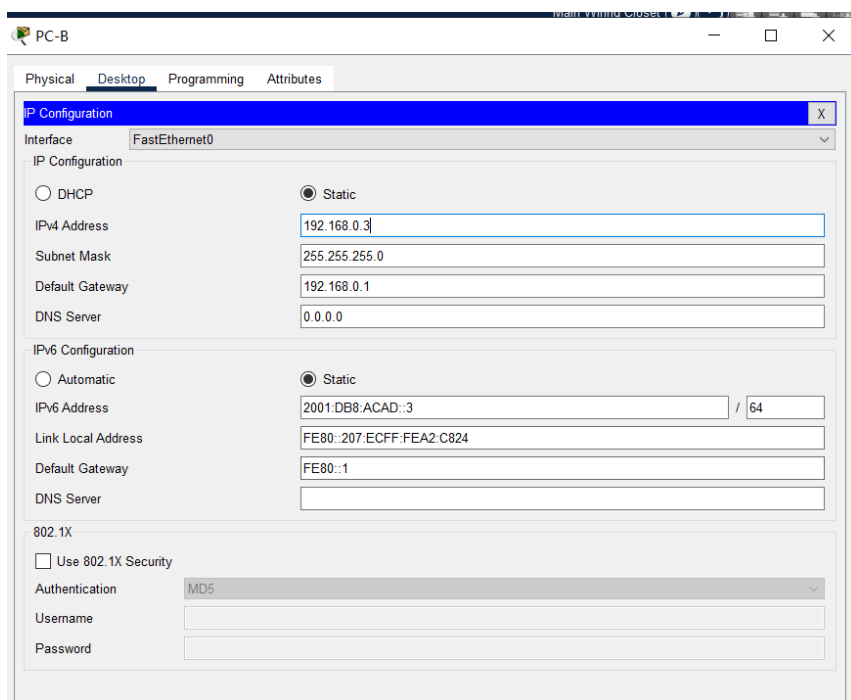

Part2

Step1

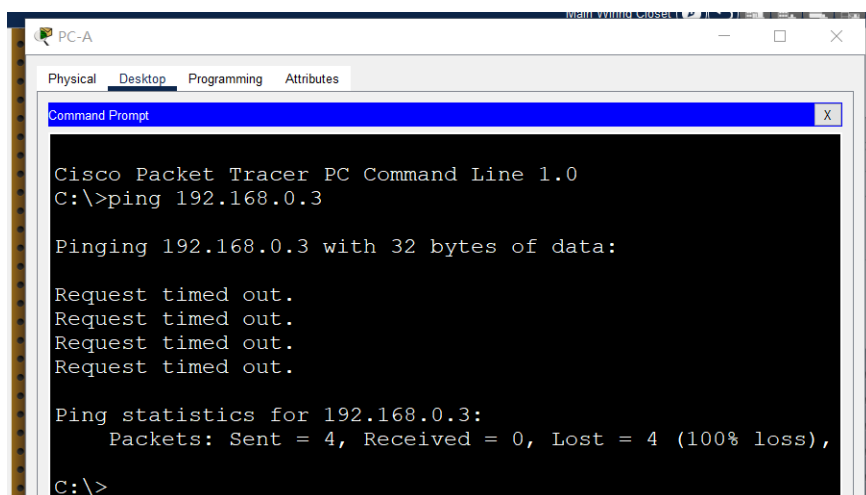

a.

b.

c.

The router interfaces, which serve as the default gateways, have not been configured. As a result, Layer 3 traffic is not being forwarded between the subnets.

Step2

a.

b.

```
Router>enable
Router#
```

b.

```
Router>enable
Router#confi term
Enter configuration commands, one per line. End with
CNTL/Z.
Router(config)#
```

cd.

```
Router(config)#hostname R1
R1(config)#enable secret class
```

e.

```

```

b.

```
[OK]
S1#ping 192.168.0.3

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.0.3, timeout
is 2 seconds:
..!!!!
Success rate is 80 percent (4/5), round-trip min/avg/max
= 0/0/0 ms
```

Part3:

Step1:

```
R1#show ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

192.168.0.0/24 is variably subnetted, 2 subnets, 2 masks
C       192.168.0.0/24 is directly connected, GigabitEthernet0/0/0
L       192.168.0.1/32 is directly connected, GigabitEthernet0/0/0
C       192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C       192.168.1.0/24 is directly connected, GigabitEthernet0/0/1
L       192.168.1.1/32 is directly connected, GigabitEthernet0/0/1
```

- What code is used in the routing table to indicate a directly connected network?

Both "C" and "L" designations are valid. "C" signifies a directly connected subnet, while "L" designates a local interface. Both responses are accurate.

- How many route entries are coded with a C code in the routing table?

2.

- What interface types are associated to the C coded routes?

G0/0/0 and G0/0/1.

b.

```
R1#show ipv6 route
IPv6 Routing Table - 5 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
        U - Per-user Static route, M - MIPv6
        I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea, IS - ISIS summary
        ND - ND Default, NDP - ND Prefix, DCE - Destination, NDR - Redirect
        O - OSPF intra, OI - OSPF inter, OE1 - OSPF ext 1, OE2 - OSPF ext 2
        ON1 - OSPF NSSA ext 1, ON2 - OSPF NSSA ext 2
        D - EIGRP, EX - EIGRP external
C   2001:DB8:ACAD::/64 [0/0]
    via GigabitEthernet0/0/0, directly connected
L   2001:DB8:ACAD::1/128 [0/0]
    via GigabitEthernet0/0/0, receive
C   2001:DB8:ACAD:1::/64 [0/0]
    via GigabitEthernet0/0/1, directly connected
L   2001:DB8:ACAD:1::1/128 [0/0]
    via GigabitEthernet0/0/1, receive
L   FF00::/8 [0/0]
    via Null0, receive
```

Step2:

a.

```
R1#show interface g0/0/1
GigabitEthernet0/0/1 is up, line protocol is up (connected)
  Hardware is Lance, address is 0060.4731.8102 (bia 0060.4731.8102)
  Description: Connection to S1
  Internet address is 192.168.1.1/24
  MTU 1500 bytes, BW 1000000 Kbit, DLY 100 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Full-duplex, 100Mb/s, media type is RJ45
  ARP type: ARPA, ARP Timeout 04:00:00,
  Last input 00:00:08, output 00:00:05, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0 (size/max/drops); Total output drops: 0
  Queueing strategy: fifo
  Output queue :0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 125 bits/sec, 0 packets/sec
    30 packets input, 3680 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 input packets with dribble condition detected
    335 packets output, 27600 bytes, 0 underruns
    0 output errors, 0 collisions, 1 interface resets
```

- What is the operational status of the G0/0/1 interface?

G0/0/1 is up, line protocol is up.

- What is the Media Access Control (MAC) address of the G0/1 interface?

0060.4731.8102

- How is the internet address displayed in this command?

Internet address is 192.168.1.1/24.

b.

```
R1#show ipv6 interface g0/0/1
GigabitEthernet0/0/1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::1
No Virtual link-local address(es):
Global unicast address(es):
  2001:DB8:ACAD:1::1, subnet is 2001:DB8:ACAD:1::/64
Joined group address(es):
  FF02::1
  FF02::2
  FF02::1:FF00:1
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ICMP unreachable are sent
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 (unspecified)
ND advertised retransmit interval is 0 (unspecified)
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
ND advertised default router preference is Medium
Hosts use stateless autoconfig for addresses.
```

Step3:

a.

```
R1#show ip interface brief
Interface      IP-Address      OK? Method Status        Protocol

FastEthernet0/21  unassigned     YES manual down          down
--More--
```

Reflection Questions

1. If the G0/0/1 interface showed that it was administratively down, what interface configuration command would you use to bring the interface up?

R1(config-if)# no shutdown

2. What would happen if you had incorrectly configured interface G0/0/1 on the router with an IP address of 192.168.1.2?

PC-A cannot successfully ping PC-B due to being on separate networks. For proper communication, PC-A relies on the default-gateway router to route packets to PC-B. However, PC-A is configured with the default-gateway address of 192.168.1.1, which is not assigned to any device on the LAN. Consequently, packets requiring routing through the default-gateway cannot reach their intended destination.

Packet Tracer - Examine the ARP Table
